

PORTFOLIO — BUILD DOCUMENTATION

Vardaan Chaddha · Build & Host Your Personal Portfolio Website assignment

1. Candidate Details

Name	Vardaan Chaddha
Roll Number / Batch	590026074
Course / Section	B.Tech CSE Core
Date	05-09-2026

2. Template / Starting Point Used

Built from scratch — no pre-made HTML/CSS template or theme was used. The page structure (index.html), stylesheet (style.css) and script (script.js) were hand-written as three plain files with no build tools or frameworks, as required by the assignment.

An AI coding assistant (see Section 3) was used as an AI boilerplate/authoring tool: it generated the initial HTML structure, CSS design system and JavaScript behaviour directly from the assignment brief, in a single design pass, rather than starting from an existing template repository.

3. AI Tools Used

Tool	Used for
Claude (Anthropic)	Reading the assignment brief; planning the visual design (a "blueprint / technical-drawing" concept); generating index.html, style.css and script.js; writing this documentation file.

4. Exact Prompts Used

The site was built and refined across the following prompts to Claude (Anthropic), summarized here in sequence:

- "Build a complete, responsive personal portfolio website using HTML, CSS and JavaScript, including a header/navigation, a hero/intro section, an About Me section, a projects section with project cards, a contact section, and a footer with a working Download Documentation button. Design it with a distinctive visual style rather than a generic template, make sure it works well on both mobile and desktop, and prepare it for hosting on GitHub Pages."
- "I can't find the name placeholder in the JavaScript file — where is it, and how do I edit it and see the result on the website?"
- "Where do I change the photo in the About Me section?"
- "Tell me what changes to make to add a real photo to the About Me section, given that I've already personalized the HTML file myself."
- "Instead of the mobile and laptop icon graphics in the project cards, I want to add two real photos — tell me what to detect and change in both project cards to swap them in."

- 6 "Why isn't the photo/project images showing up after I added the files and updated the code?"
- 7 "Only the LinkedIn contact link doesn't work – it shows a file-couldn't-be-accessed error. Why, and how do I fix it?"
- 8 "Remake the Portfolio Build Documentation according to the assignment with my real name, roll number, course, date, AI tool used, a summary of the prompts used so far, and my live site and GitHub repository links."

5. Method / Approach

- 1 Planned the required sections, the download-button behaviour, and the hosting + documentation requirements before writing any code.
- 2 Chose a visual design direction before building: a 4–6 colour token system, a type pairing (Space Grotesk for display, JetBrains Mono for labels, Inter for body text), and a "blueprint / technical drawing" layout concept (grid-paper backgrounds, registration marks, a footer styled like an engineering drawing title block).
- 3 Built index.html with all six required sections in semantic HTML: header/navigation, hero, about, projects (3 cards), contact, and a footer that doubles as the documentation download point.
- 4 Built style.css mobile-first with CSS custom properties for the design tokens, fluid type via clamp(), and responsive breakpoints at 900px, 700px and 480px so the layout adapts from a single phone column up to the full desktop grid.
- 5 Built script.js (vanilla JS, no libraries) for the mobile nav toggle, scroll-based nav highlighting, scroll-reveal animation, the hero typewriter effect, and a contact form that opens a pre-filled email in the visitor's mail client (no backend is available on GitHub Pages).
- 6 Personalized every placeholder with real content: name, bio, roll details, skills, three real projects with links, and contact details.
- 7 Replaced the placeholder avatar and project icons with real photos, wiring an automatic fallback so the generic icon still shows if a photo file is ever missing or misnamed.
- 8 Diagnosed and fixed two real bugs found while personalizing the site: a filename mismatch that kept project photos from loading, and a missing https:// protocol that broke the LinkedIn link.
- 9 Generated this documentation.pdf and wired it to the footer's "Download Documentation" button via a plain anchor tag with the download attribute, so it works without any JavaScript.
- 10 Pushed all files to a public GitHub repository and enabled GitHub Pages to get the live link below.

6. Live Link & GitHub Repository
