

PORTFOLIO — BUILD DOCUMENTATION

Prepared for: Build & Host Your Personal Portfolio Website assignment

1. Candidate Details

Name	[Your Full Name]
Roll Number / Batch	[Your Roll Number / Batch]
Course / Section	[Your Course & Section]
Date	[Submission Date]

Replace the bracketed placeholders above with your own details before submitting.

2. Template / Starting Point Used

Built from scratch — no pre-made HTML/CSS template or theme was used. The page structure (index.html), stylesheet (style.css) and script (script.js) were hand-written as three plain files with no build tools or frameworks, as required by the assignment.

An AI coding assistant (see Section 3) was used as an AI boilerplate/authoring tool: it generated the initial HTML structure, CSS design system and JavaScript behaviour directly from the assignment brief, in a single design pass, rather than starting from an existing template repository.

3. AI Tools Used

Tool	Used for
Claude (Anthropic)	Reading the assignment brief; planning the visual design (a "blueprint / technical-drawing" concept); generating index.html, style.css and script.js; writing this documentation file.

If you personally used any other AI tool while customizing the site (e.g. for the avatar image, resume text, or project copy), add it as an additional row before submitting.

4. Exact Prompts Used

The assistant was given the assignment PDF itself as the specification, followed by this instruction:

`"Attempt this assignment for me, and after the code, tell me how to host it on GitHub so that I can finalize my submission. Strictly follow all the instructions given in the PDF and explain how to proceed further from the end point in time."`

Add any further prompts you personally send the AI tool below (for example, requests to swap in your real name, bio, projects, colors, or links):

- [Add your follow-up prompt here]
- [Add your follow-up prompt here]

5. Method / Approach

- 1 Read the assignment brief and listed the required sections, the download-button behaviour, and the hosting + documentation requirements.
- 2 Planned a visual design direction before writing code: a 4–6 colour token system, a type pairing (Space Grotesk for display, JetBrains Mono for labels, Inter for body text), and a "blueprint / technical drawing" layout concept (grid-paper backgrounds, registration marks, a footer styled like an engineering drawing title block).
- 3 Built index.html with all six required sections in semantic HTML: header/navigation, hero, about, projects (3 cards), contact, and a footer that doubles as the documentation download point.
- 4 Built style.css mobile-first with CSS custom properties for the design tokens, fluid type via clamp(), and responsive breakpoints at 900px, 700px and 480px so the layout adapts from a single phone column up to the full desktop grid.
- 5 Built script.js (vanilla JS, no libraries) for: the mobile nav toggle, scroll-based nav highlighting, scroll-reveal animation, the hero typewriter effect, and a contact form that opens a pre-filled email in the visitor's mail client (no backend is available on GitHub Pages).
- 6 Generated this documentation.pdf and wired it to the footer's "Download Documentation" button via a plain anchor tag with the download attribute, so it works without any JavaScript.
- 7 Tested the layout at phone and desktop widths, then pushed the three files plus this PDF to a public GitHub repository and enabled GitHub Pages to get the live link.
- 8 Personalized every bracketed placeholder ([Your Name], project details, email, social links, avatar) with real content before final submission.

6. Live Link & GitHub Repository

Live site (GitHub Pages)

[<https://your-username.github.io/your-repo/>]

GitHub repository

[<https://github.com/your-username/your-repo>]

Fill in both links only after the site is pushed to GitHub and Pages is enabled — see the hosting steps provided alongside the code.

REV.01 · Generated as part of an AI-assisted build process. Replace every bracketed placeholder in this document before submission.
